

Steps

After reviewing the resources for this assignment, do the following steps...

1: Choose at least three items from the resource video associated with your operating system and perform those optimizations on your PC.

- Open a blank Word document. Make sure you put your name, class and due date of the assignment.
- Record the optimization items on the Word document.
 - For each optimization item, evaluate and document in the Word document whether you saw a change in your PC's performance after performing the optimization.
 - For each optimization item, note whether you would recommend this optimization to other users.

2: Using the application list associated with your operating system (Add/Remove Apps in Windows, LaunchPad and Applications folder on MacOS), identify applications that you do not use and aren't planning on using. Document these applications on the Word document.

- Remove the unneeded applications.
 - For each removed application, evaluate and document whether you saw a change in your PC's performance.
 - For each removed application, note whether you would recommend this to other users.

Windows 11 on my laptop

1.

The first optimization I made was enabling storage sense and deleting unimportant files. Once I did this, I didn't notice any major changes immediately. I believe that it's better to delete these files to avoid pileups and future clutter. Catching it now and handling it is much better than leaving it for later.

The second optimization I made was adjusting my privacy settings. I was surprised looking through some of these options at first, since it's essentially just taking your data and tracking you. In the past I would get advertisements about things that I already know and

like, mainly due to this setting. As soon as I turned these options off, I did some exploring by opening random sites and applications that show ads. I didn't find any noticeable difference, but I assume that in the future I'll notice the change. Overall, I would recommend doing this, since it gives you much more privacy.

The last optimization I made was adjusting the visual effects of my computer. After unselecting around 10 different effects, I didn't see much of a change in my computer. I was a bit confused after applying the changes because some of the visuals I would normally see weren't there anymore. It was confusing for a bit, but I got used to it. Overall, I wouldn't recommend doing this since it doesn't free that much space and can be more of a detriment than help.

2.

Removed Applications:

Alexa: It was a small app that I never installed.

I saw no difference in performance.

I would recommend removing this app unless you have and are using Alexa.

Family: An app that comes with my device. I think it's to document your family and communicate with them.

I saw no difference in performance.

I would recommend deleting this app since it is probably easy to track you and your family using it.

Minecraft: I haven't played this game on my device in a while, and it was 1.68 gigabytes of space.

After deleting my device feels a bit faster but it might just be placebo.

I recommend deleting apps that haven't been used in a while, especially if they're large apps.
